

Psych. 280 First Time Users

MAHAR 210 COMPUTER LOG ON PROCEDURES

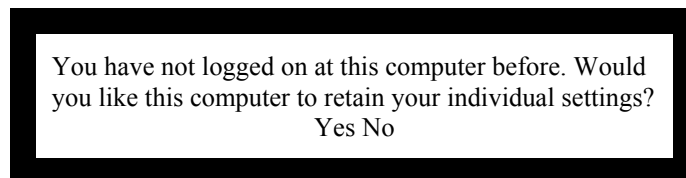

1. If the machine is not already turned on, push the top button at the center of computer box, not the monitor. Wait for the computer to load Windows and give you a box in the center of the screen.

UserName:
Password:

Click in the white zone that is either empty or has a previous username in it. If a previous username is there delete it, and type your username, but **DO NOT** press enter. Instead, using the mouse click in the white zone that is adjacent to the word password. Now type your password in this white area. Stars will appear. Now mouse up to the word OK and click it.

2. If you have not used this particular computer console before you will get a message.

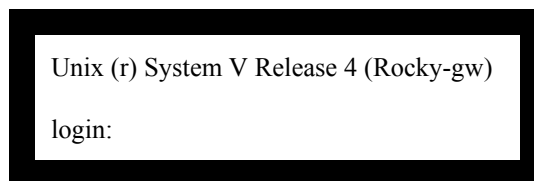

You have not logged on at this computer before. Would
you like this computer to retain your individual settings?
Yes No

Click Yes. The computer will now load software for a minute or two. Be patient and wait.

Log On Instructions for Connecting to Rocky on the Mainframe

3. After the programs have loaded, if you wish to connect to Rocky on the Mainframe, mouse to the little **black box** with the little green dot in it (which is in the lower left corner of the computer screen next to the word **start**) and click on it. When you do a Window will open that looks like the one below:

Unix (r) System V Release 4 (Rocky-gw)

login:

4. Type in your username next to the word **login** and hit enter.
5. You will now get the word **Password**: Type in your password here and hit enter.
6. You are now logged on the system and will get a system prompt (which will be your username). When you do get a system prompt mouse to the upper right corner of the window and click on the **box** or **square** which is in between the - and the x. This will maximize the screen to make things larger.
